

Longevity and wastage in ewes

**Anne Ridler, Kate Griffiths, Rene Corner-Thomas,
Paul Kenyon**
IVABS, Massey University

What is meant by longevity and wastage?

- Longevity = ability of ewe to survive and be productive until culled for age
- Wastage = ewes that do not meet the above
 - Culled prematurely
 - Die on-farm

Why is it of interest?

I wonder how long she'll last in the flock?

Some related questions

- Can I identify young ewes that will/won't last in the flock?
- Does hogget mating affect longevity?
- If a ewe has twins every year will she get worn out and drop out of the flock?
- Will a skinny ewe always be a skinny ewe?

Research plan

- ~12,000 ewe hoggets tagged (2010 & 2011)
- ~85% bred as hoggets, ~15% not

Research plan

- Follow through their lives
 - Weigh & BCS 4 times a year
 - Repro data (scanning, wet/dry)
 - Date & reason for cull
 - Collect tags from dead
 - One farm: necropsy ~50 thin ewes/year at scanning time

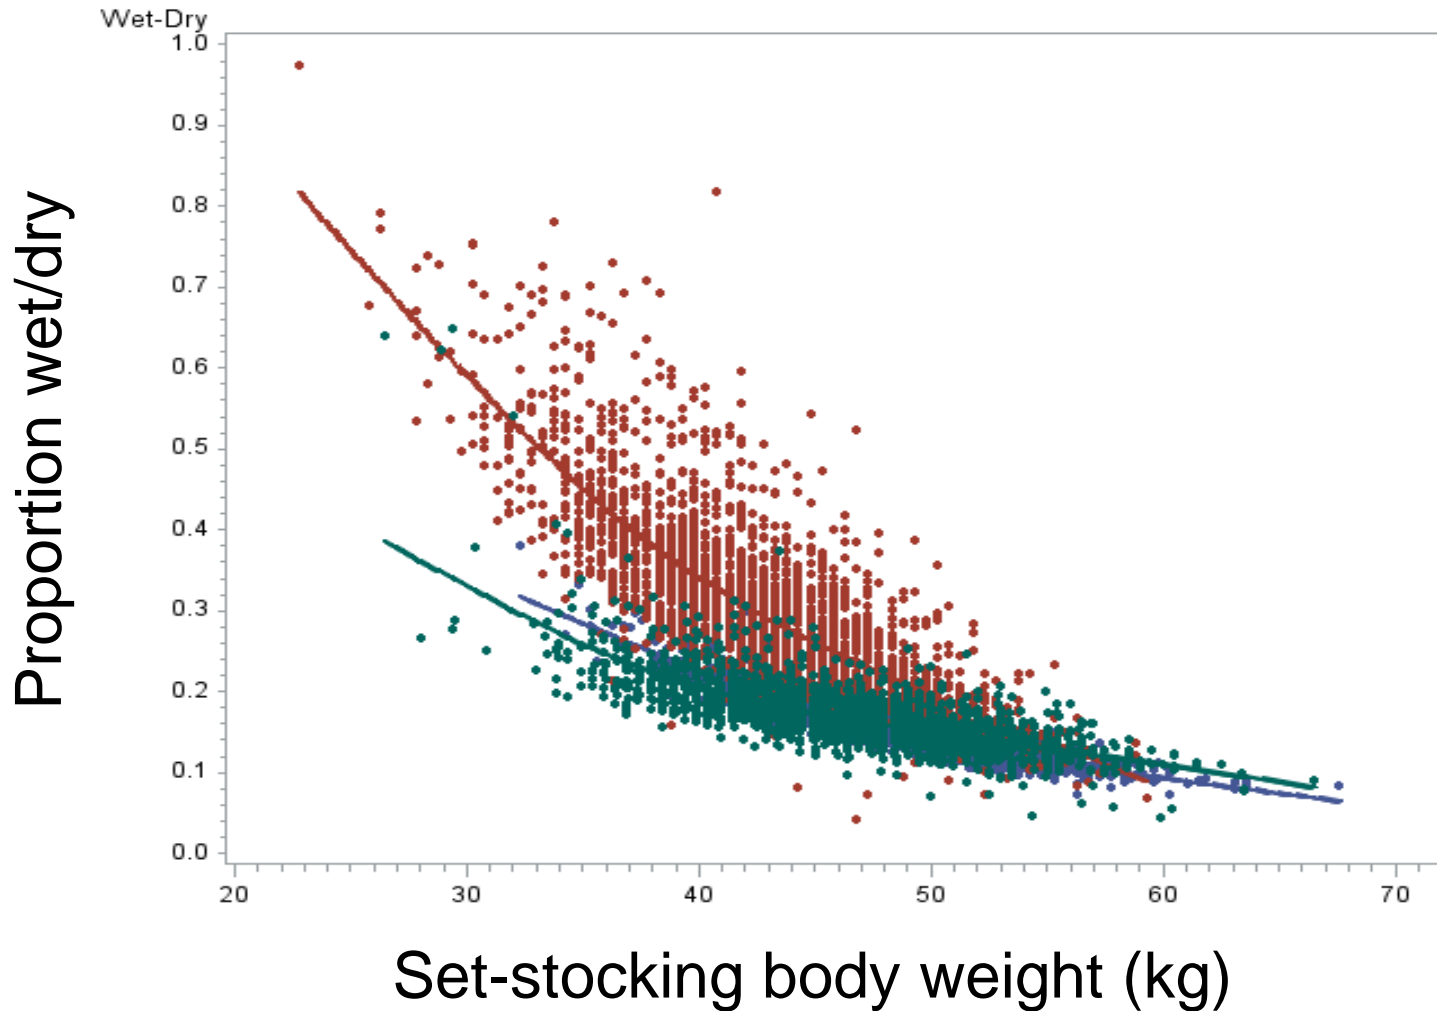

Where are we at?

- Most 2010-born have been culled
- Remainder culled for age in next 1-2 years
 - Main results still unknown
- Analysis on hogget data largely completed

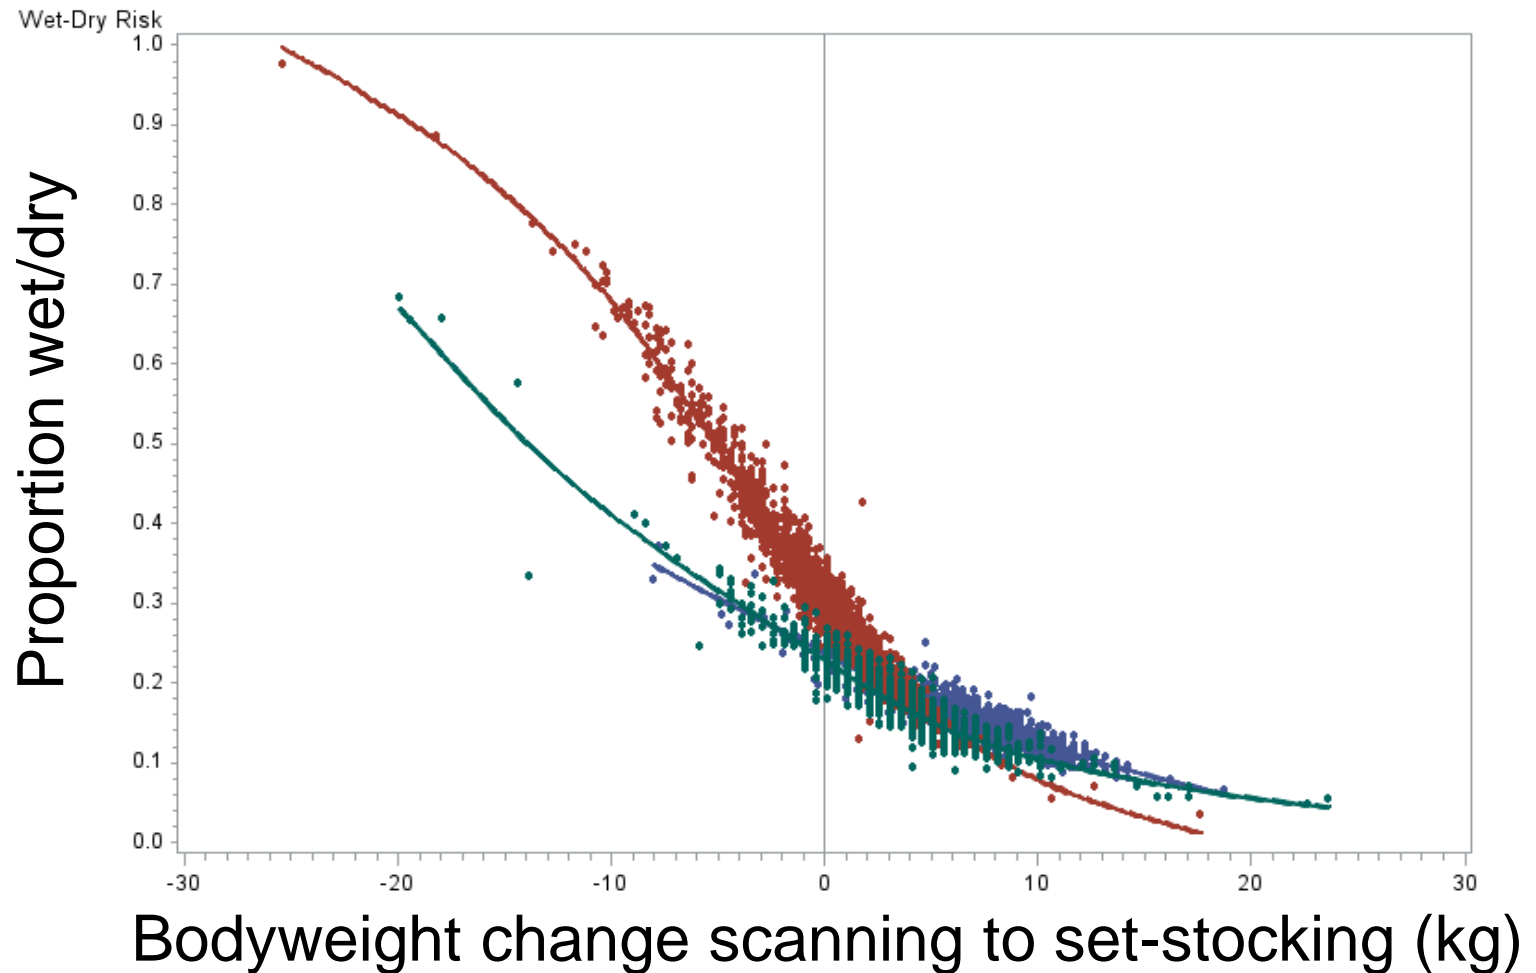

Results: Hogget reproduction

- Mating weight has a big impact on:
 - Pregnancy rate
 - Scanning rate
- Success in rearing a lamb (wet or wet/dry) is influenced by:
 - Scanning & set-stock weight
 - Set-stock BCS
 - Weight change during gestation

Hogget set-stocking weight & likelihood of being wet/dry

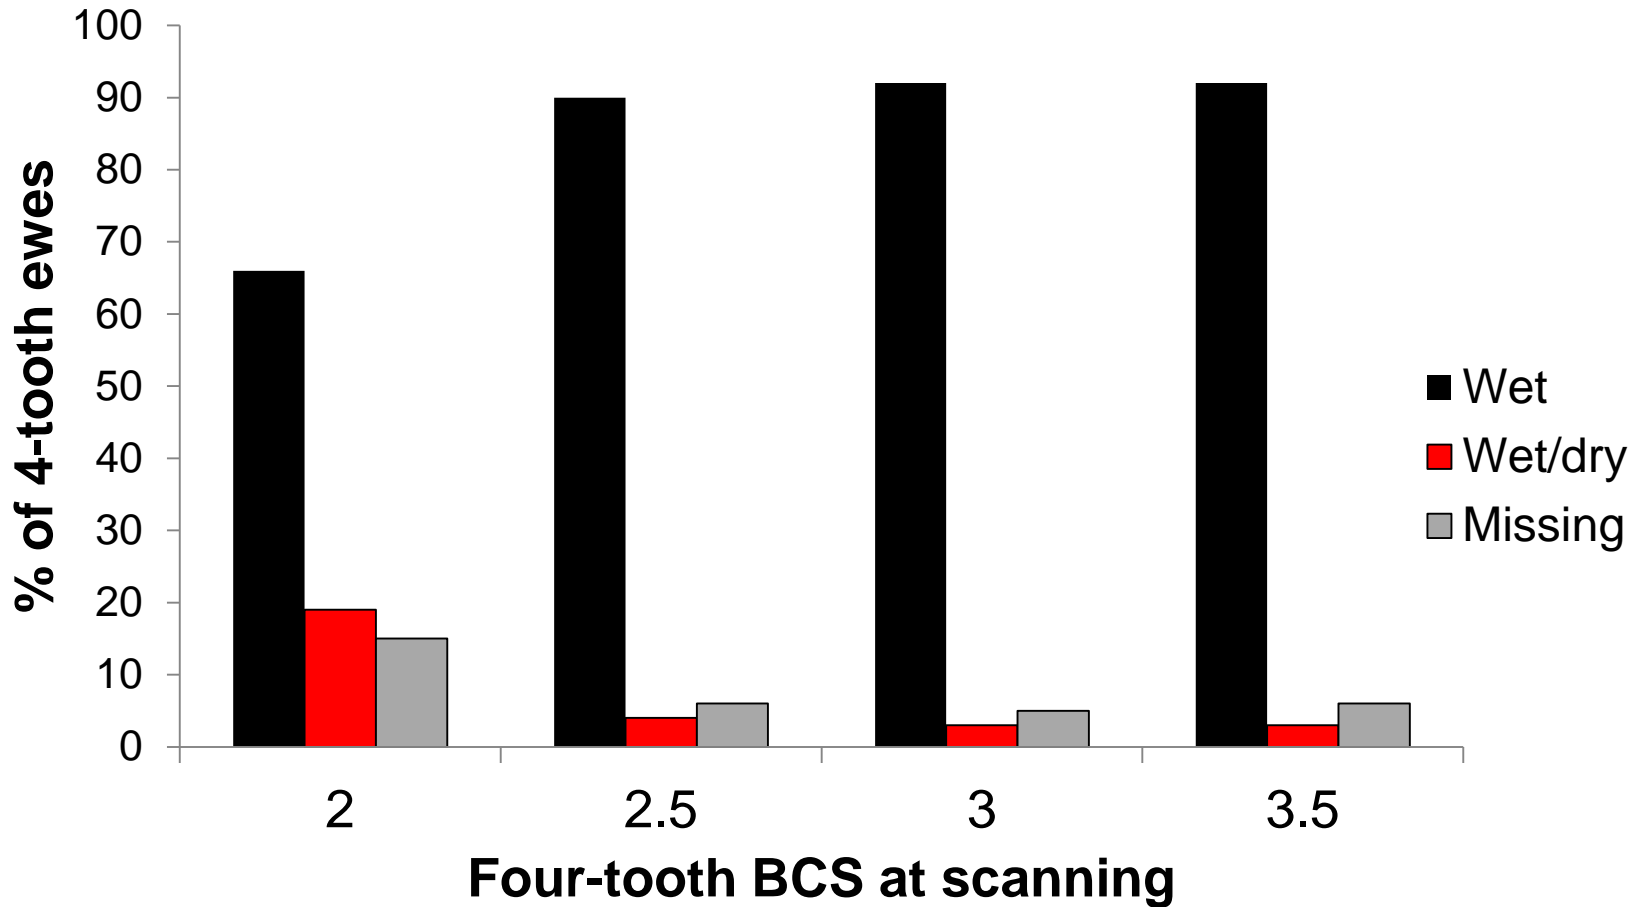

Hogget weight change during pregnancy & chance of wet/dry

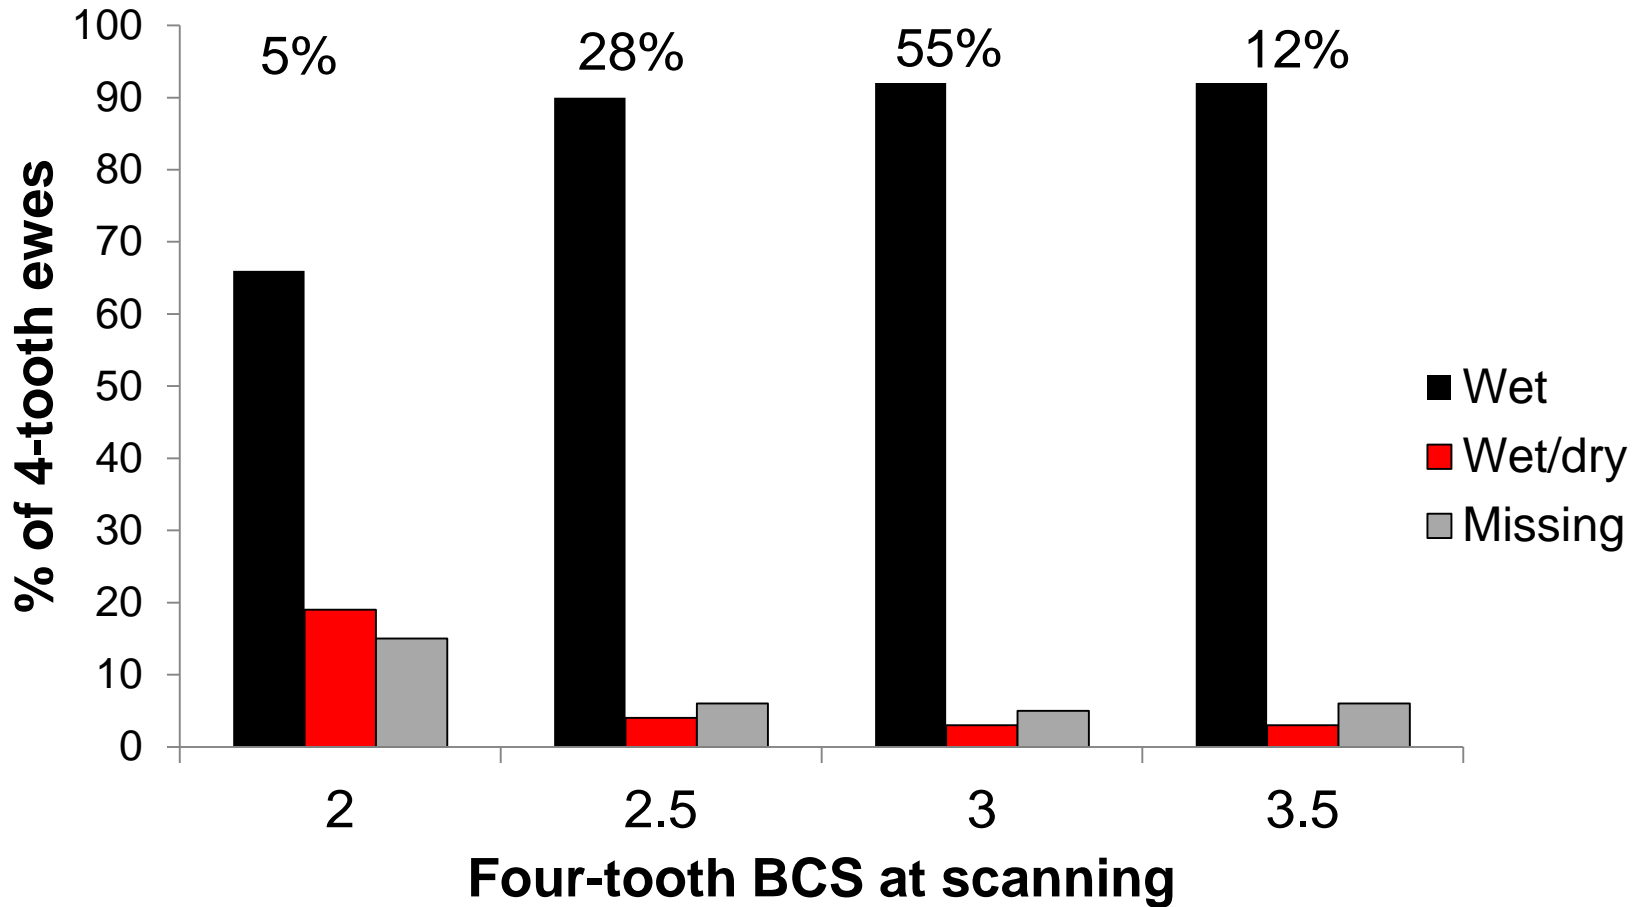

Results: Ewes

- Data still being collected so analysis not completed
- Crude analysis of BCS and wet/dry data suggest:
 - Ewes in poor BCS (2 or less) more likely to die on-farm or be wet/dry
 - Wet/dry hoggets or ewes don't have increased likelihood of being wet/dry again

Four-tooth BCS at scanning and lambing outcome (6,300 ewes)

Four-tooth BCS at scanning and lambing outcome (6,300 ewes)

The cost of thin ewes at scanning

- 1,000 ewes, 150% scanning
- 5% BCS ≤ 2 at scanning
=50 thin ewes
- 10% \uparrow in missing/dead = 5 ewes + 7.5 lambs
 - @\$60/ewe & \$60/lamb = \$750
- 15% \uparrow in wet/dry = 11.3 less lambs
 - @\$60/lamb = \$680

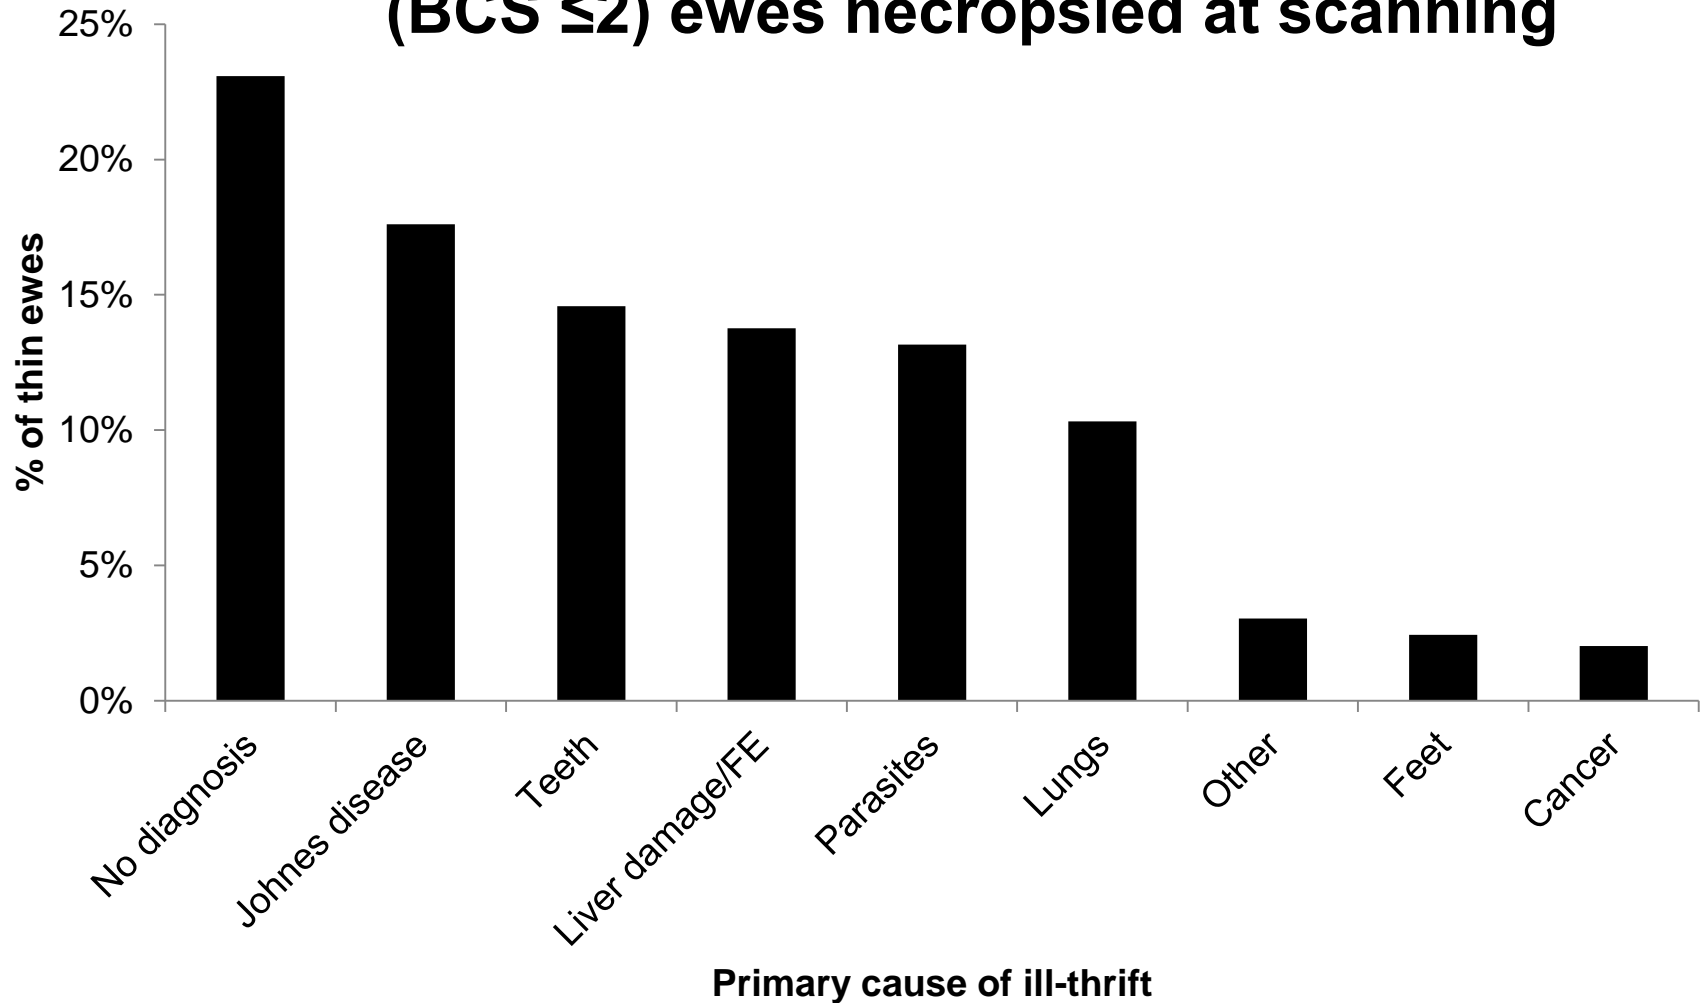

The cost of thin ewes at scanning

- For every 1,000 ewes, minimum* losses due to having 5% thin at scanning = \$1430
~\$30/thin ewe
- Energy required to get thin ewes from BCS 2 to BCS 3 = ~220MJME or ~20kgDM

*Does not factor in loss of 1 twin or likely ↓ growth rates of lambs born to thin ewes

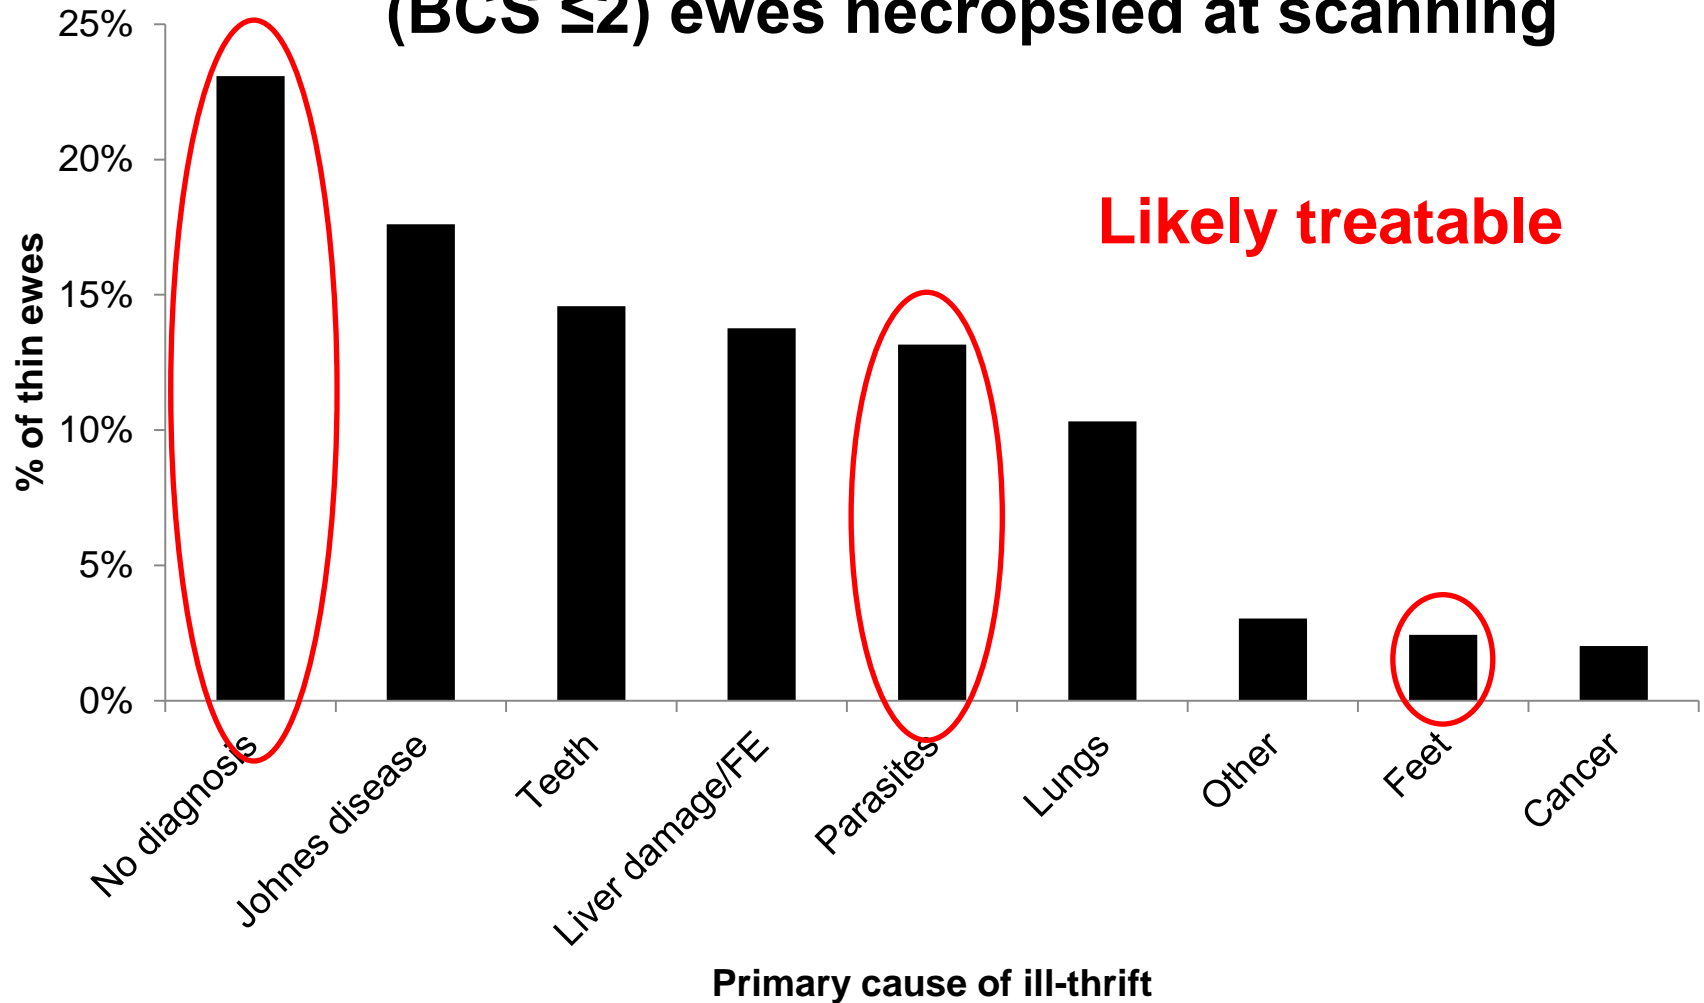

Causes of thin ewes?

Primary cause of ill-thrift from 494 very thin (BCS ≤ 2) ewes necropsied at scanning

Causes of thin ewes?

Primary cause of ill-thrift from 494 very thin (BCS ≤ 2) ewes necropsied at scanning

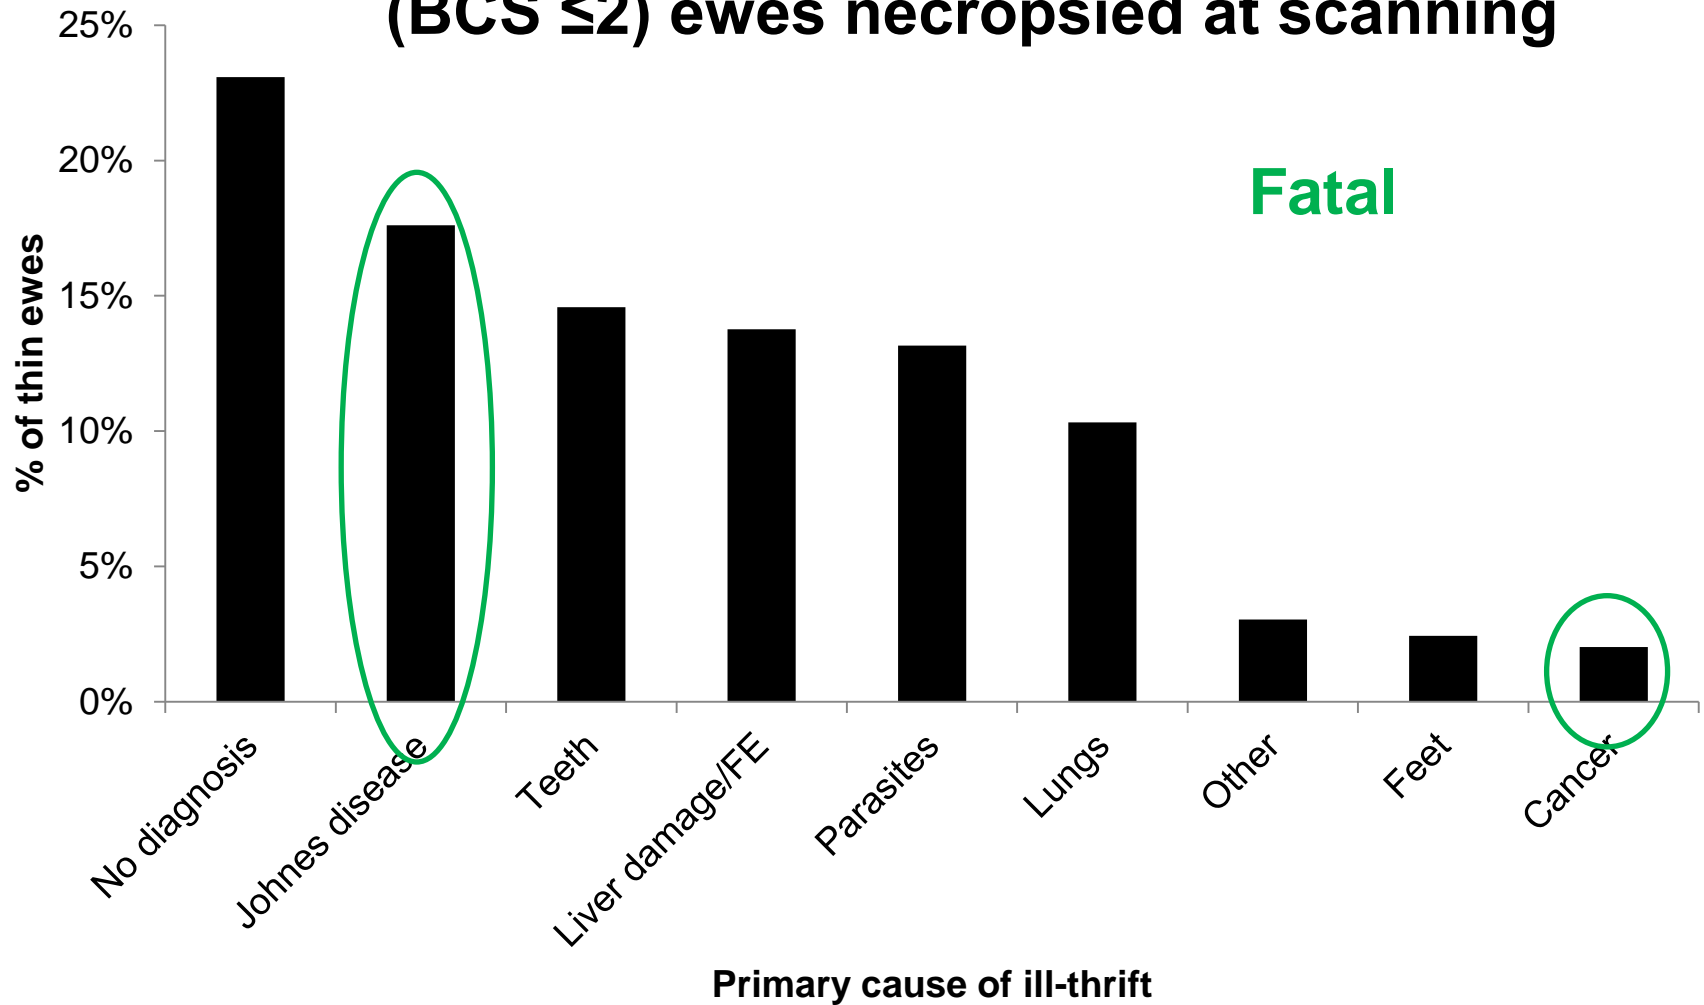

Causes of thin ewes?

Primary cause of ill-thrift from 494 very thin (BCS ≤ 2) ewes necropsied at scanning

Causes of thin ewes?

Primary cause of ill-thrift from 494 very thin (BCS ≤ 2) ewes necropsied at scanning

Summary of ewe necropsy study

- Of 494 ewes that were very thin at pregnancy scanning:
 - ~40% had problems that were likely treatable
 - ~40% had conditions that would likely respond to better feeding
 - ~20% had conditions that were fatal
- ~80% would likely respond to better feeding and/or treatment**

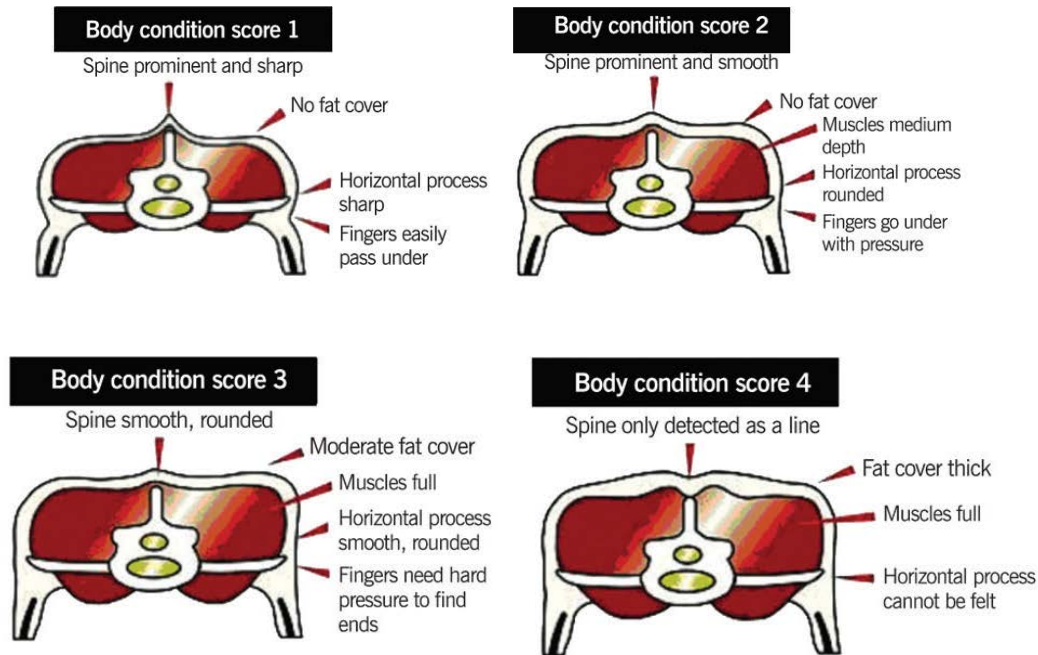

What to do with thin ewes?

- Identify and separate
- Cull any that are really bad (BCS 1)
- Drench and treat obvious issues (feet)
- Improve feeding
- Re-assess after 3 weeks
- Cull any that don't improve

BCS ewes at scanning (and weaning)

Need to put your hand on them

Differentiate between 'too thin' and 'OK'

Too thin

OK

Other findings so far

- Main reasons for wastage:
- Wet/dry ewes (culled)
- **Sheep going ‘missing’ (presumed dead)**
 - 6-12% per annum
 - Throughout year but higher over lambing

Ewe survival to 4.5 years old

Where to from here?

- Complete longevity dataset and analyse
- Udder study
- Hogget and lamb survival over lambing
- On-farm ewe mortality studies?

Udder study

- Why?
 - Wet-dry ewes
 - Ewes culled based on “poor udder”
 - Lamb growth
- Aims?
 - Define “poor udders” & effect on lamb rearing
 - Scoring system for farmers

Udder study - research plan

- 1,200 commercial ewes
- Data collected 4 times/year
 - Weights & BCS
 - Udder scores
- Lamb survival & weights

Take-home messages so far

- If mating hoggets, ensure:
 - Big enough at mating (40kg+)
 - Grow well (100-150g/day) throughout gestation
- BCS ewes at weaning and scanning; look after thin ewes
- Full results available in 2 years' time!
